KNOW OUR SOLUTIONS

The standard recuperator is equipped with a V2 DISPLAY.

The recuperator is standardly equipped with a V3 controller.

Modbus RTU is one of the most popular communication protocols in automation systems - it allows you to connect the recuperator to the so-called smart home.

The XF system enables automatic balancing of the installation by continuously measuring the current supply and exhaust air flow.

Air handling unit has a modern, smart pre heater that adjusts its power to the temperature of the air, its amount and flow.

The standard recuperator has a built-in internet module, thanks to which it can be remotely controlled.

Bypass is used to cool the rooms. It is activated mainly in the summer, when the temperature in the room is higher than the comfort temperature and the outside temperature at night is lower than it.

The evaporative air humidifier used inside the unit will help maintain the appropriate level of humidity in the rooms, especially in winter.

The recuperator has ready integration with the Sinum system, a Polish building management system for controlling and monitoring building devices.

The recuperator has an aluminum counterflow heat exchanger. The heat exchanger maintains the best ratio of efficiency to air flow resistance.

The plastic, high-efficiency counterflow heat exchanger used in the recuperator is made of high quality polystyrene.

The enthalpy exchanger recovers both heat and humidity.

To ensure high hygiene and durability, the inside of the recuperator was powder coated with polyester paint.

The body of the recuperator is made entirely of durable foamed polypropylene.

The built-in heater-cooler module, when connected to a heat and/or cooling source, will additionally cool or heat up the air supplied to the rooms.

The recuperator has a wireless humidity sensor included in the price.

The recuperator has ready integration with the Home Assistant system, one of the most popular building control systems.
